The health benefits of exercise far outweigh the risks across the population. Nevertheless, pre-exercise screening is an important safety net to ensure that individuals who may have a medical condition that puts them at a higher risk of an adverse event during exercise can be identified and managed accordingly.

Using the National Standardised Pre-Exercise Screening System
The Adult Pre-Exercise Screening Tool will enable you to gather detailed information about the health or disease of your new clients or members in a way that is consistent with nationally recognised professional practice and in accordance with the most current evidence about exercise risk. The two-staged approach allows for practical application of the tool across a range of settings.

Adopting the new system will provide you with:
Reduced risk of serious injury or incidents:
Accurate client knowledge will support appropriate exercise prescription and can significantly reduce the likelihood of a serious injury or incident occurring as a result of your professional advice.

Strengthened Professional Reputation:
Developed in collaboration by Exercise and Sport Science Australia [ESSA], Fitness Australia [FA], Sports Medicine Australia [SMA] and Exercise is Medicine [EIM] the new system is recognised across fitness and allied health disciplines. Adopting the national standardised system will improve your ability to build referral relationships and engage in professional communication about client conditions.

Evidence of your Duty of Care:
The Australian professional standards and codes of practice set down by SMA, ESSA, EIM and Fitness Australia recommend that client screening is undertaken as an essential component of exercise prescription. The inclusion of client screening is therefore a significant consideration during legal cases concerning personal injury sustained through an exercise session or program.
